

# Sprint 2

## Deployment Environment

Web Server:

ec2-18-216-214-86.us-east-2.compute.amazonaws.com

## Login Credentials

Username: guest

Password: guest!

## Functional Requirements (Updates From Sprint 1 Bolded)

- Submit Photographs
  - User must be able to select files to upload
  - **Uploaded files must be ranked by the machine learning algorithm and have relevant information uploaded to the database**
- Search
  - User must be able to input SQL queries into the database and have results returned
  - **The image, rating, and whether or not the image will be kept must be displayed**
- Delete Photographs
  - **User must be able to mark photos they want to delete, indicated by a red border around an image**
  - **User must be able to mark photos they want to keep, indicated by a blue border around an image**
  - **Clicking a photo changes whether or not it is marked for deletion**
  - **Photographs marked by the user to be deleted must be deleted**
- Login
  - User must be able to login into the system when correct credentials are provided
  - User must not be able to access site content when not logged in.

## Database Design

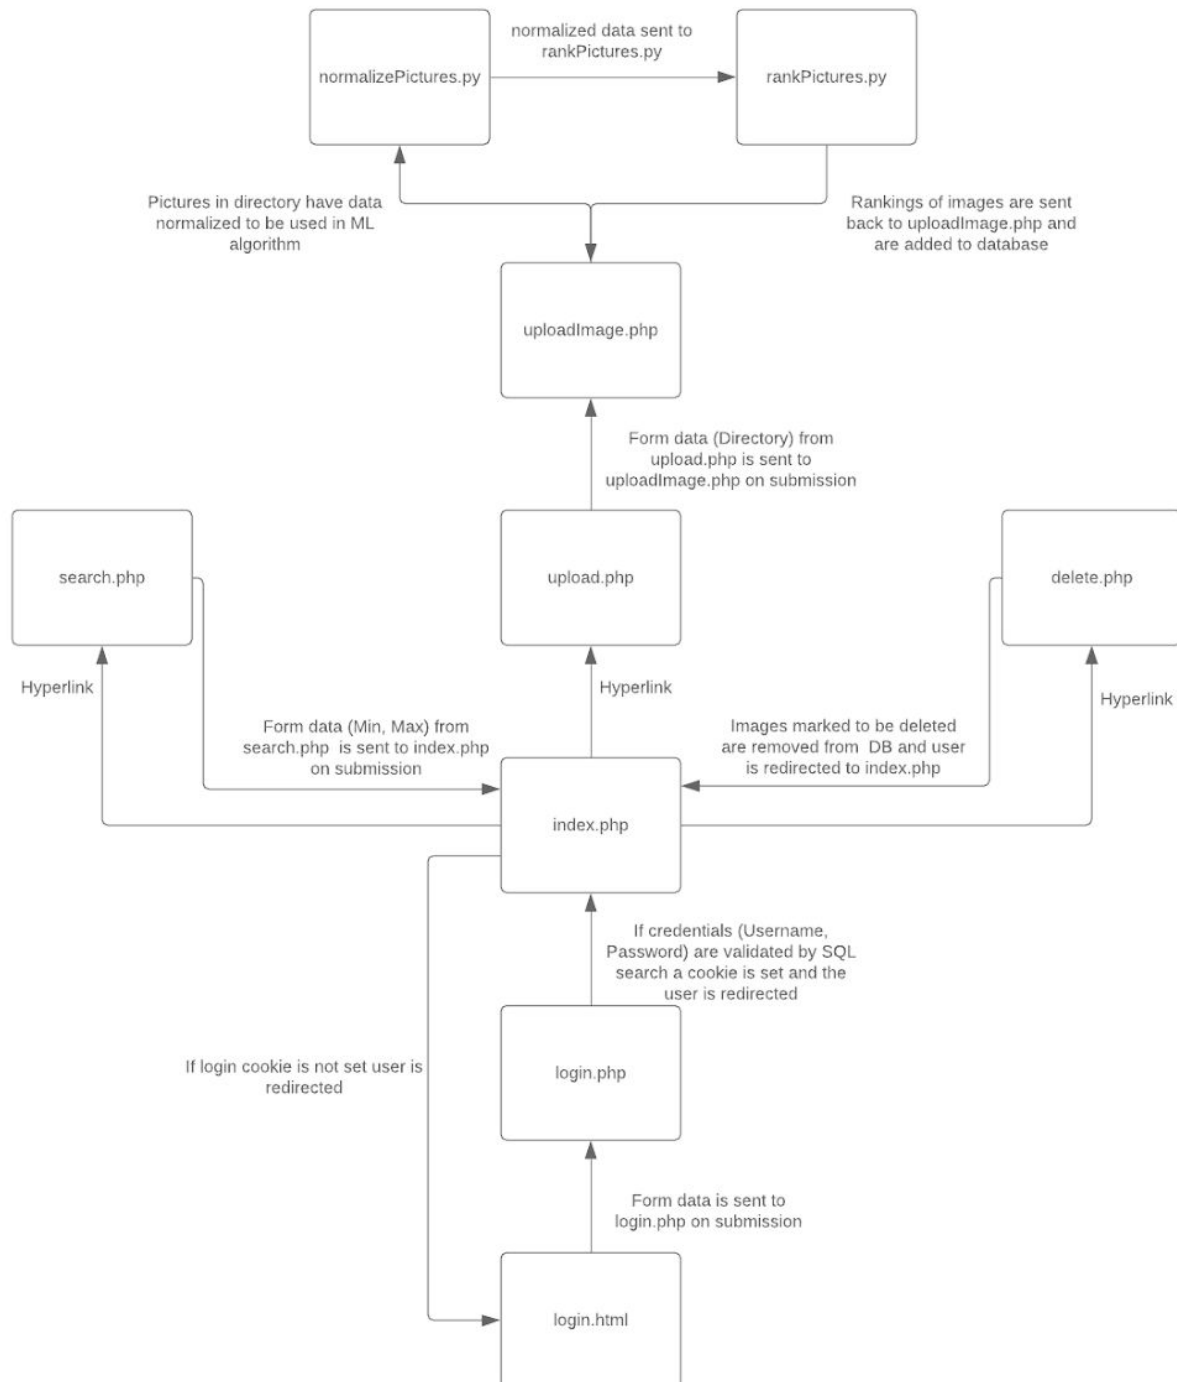

### ERD

### DDL

```
CREATE TABLE Photograph (  
    Filepath varchar(256) NOT NULL,  
    UserUploadedBy varchar(256) NOT NULL REFERENCES User(User),  
    Rating int NOT NULL,  
    Keep boolean DEFAULT TRUE,  
    Category varchar(256) DEFAULT 'N/A',  
    PRIMARY KEY(Filepath)  
);  
  
CREATE TABLE User (  
    User varchar(256) NOT NULL,  
    Password varchar(256) NOT NULL,  
    PRIMARY KEY(User)  
);
```

## Unit Testing

Testing if 'keep' status of images can be toggled from index.php

```
1 • SELECT Keep FROM Photograph WHERE Rating=20;
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
Keep				
1				

```
1 • SELECT Keep FROM Photograph WHERE Rating=20;
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
Keep				
0				

*Testing if images can be searched using HTML form*

### Status Update

- Complete
  - Searching images
  - Marking images for deletion
  - Deleting images
  - Logging in
- Not Complete
  - Uploading images
    - Images are able to be uploaded into the database but because the machine learning isn't operational the ranking and keep tags are set to zero
    - Once machine learning is completed finishing this will be trivial
  - Ranking images
    - Data normalization is proving to be difficult

- Several methods have been tried but the program continues to be inoperational
- Advice on how to overcome this will most likely be needed, will be sought in office hours next week
